

(a) Two stories of demand on the worked day

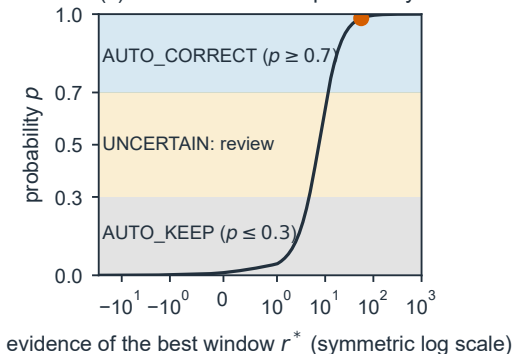

- recorded net load y
- demand, sign flipped in W^*
- solar estimate s
- best window W^*
- demand, sign kept ($s + y$)
- reviewers' span

(b) Evidence of every admissible window

(c) From evidence to probability to decision

- p under the release calibration
- worked day: $r^* = 55.9$, $p = 0.984$
